

What is a supercapacitor?

A supercapacitor is a specially designed capacitor which has a very large capacitance. Supercapacitors combine the properties of capacitors and batteries into one device. Supercapacitors have charge and discharge times comparable to those of ordinary capacitors.

What are supercapacitors & EDLC?

Supercapacitors, also known as ultracapacitors and electric double layer capacitors (EDLC), are capacitors with capacitance values greater than any other capacitor type available today. Supercapacitors are breakthrough energy storage and delivery devices that offer millions of times more capacitance than traditional capacitors.

Where can I buy 500 F supercapacitors / ultracapacitor?

Supercapacitors /Ultracapacitors 500f 2.7V +50% /-20% tol. Supercapacitors /Ultracapacitors 500f 2.7V +50% /-20% tol. 500 F Supercapacitors /Ultracapacitors are available at Mouser Electronics. Mouser offers inventory, pricing, & datasheets for 500 F Supercapacitors /Ultracapacitors.

What makes supercapacitors different from other capacitors?

Available in a wide range of sizes, capacitance and modular configurations, supercapacitors can cost-effectively supplement and extend battery life, or in some cases, replace batteries altogether. What makes supercapacitors different from other capacitor types are the electrodes used in these capacitors.

What is the maximum charge voltage of a supercapacitor?

While an ordinary electrostatic capacitor may have a high maximum operating voltage, the typical maximum charge voltage of a supercapacitor lies between 2.5 and 2.7 volts. Supercapacitors are polar devices, meaning they have to be connected to the circuit the right way, just like electrolyte capacitors.

Installed a bank of super capacitors Maxell 2.7v Cell's 3000F for a net of 500F (farads) My take on them is this analogy. The difference with and without to me is like the difference you hear when listening to a portable boom box on day old batteries vs. being plugged in.

I think you meant second instead of minutes. 1 Farad = 1 Coulomb per Volt 1 Coulomb = 1 Amp-Second 1 Farad = 1 Amp-Second per Volt Assuming no losses, and 100% use of stored energy, A 5V charge on 1F is a capacity of 5 Amp Seconds, or ~1.39mAH

Supercapacitors, compared to capacitors, have a larger area for storing more charge, with capacitance into the farad (F) range, and they store more energy than electrolytic capacitors. They have a low leakage current and are suitable for many applications that can operate in the 1.8V - 2.5V range.

The unit of capacitance is Farad (F) which is named after M. Faraday. Farad is the capacitance unit in respect of coulomb/volt. If we say a capacitor with 1 Farad, then it will create a 1-volt potential difference between its plates depending on the 1-coulomb charge. 1 Farad is a very large value capacitor to use as a general electronic component.

This calculator converts capacitance value between units pF, nF, µF and F. The capacitor code conversion chart lets you find the capacitance by looking up the code. The first two digits are the value in picofarads, while the third is the ...
