

What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges from the grid or a power plant and then discharges that energy to provide electricity or other grid services when needed.

How long can a battery store and discharge power?

The storage duration of a battery is determined by its power capacity and usable energy capacity. For example, a battery with 1MW of power capacity and 6MWh of usable energy capacity will have a storage duration of six hours.

How does a battery charging system work?

Customers can set an upper limit for charging and discharging power. During the charging period, the system prioritizes charging the battery first from PV, then from the power grid until the cut-off SOC is reached. After reaching the cut-off SOC, the battery will not discharge, and the photovoltaic output will also be normal.

Who uses battery storage?

Battery storage is a technology that enables power system operators and utilities to store energy for later use.

How does the state of charge affect a battery?

The state of charge greatly influences battery's ability to provide energy or ancillary services to the grid at any given time. Round-trip efficiency, measured as a percentage, is a ratio of the energy charged to the battery to the energy discharged from the battery.

How do energy storage batteries work?

At their core, energy storage batteries convert electrical energy into chemical energy during the charging process and reverse the process during discharging. This cycle of storing and releasing energy is what makes these batteries indispensable for applications ranging from electric vehicles to grid energy management.
