The inverter job is to take this DC input and to give AC output, where the magnitude and frequency can be controlled. The efficiency parameters of an inverter such as switching losses and harmonic reduction are principally depended on the modulation strategies used to control the inverter. There are several techniques of Pulse Width Modulation ...

The result of this is that the average power over each segment will result in a sine wave pattern. The more segments the cycle is broken into, the smoother the sine wave will be and the closer it will mimic a real AC sine wave. The motor will see the average value and will therefore experience a sine wave alternating current.
