What happens if you charge a battery outside a recommended temperature range?

*Image Source: Most all battery chemistries will experience some type of damage when charging outside recommended temperature ranges. The type of damage may differ based on the specific materials used in the battery.

What temperature should a battery be charged?

Batteries can be discharged over a large temperature range, but the charge temperature is limited. For best results, charge between 10°C and 30°C (50°F and 86°F). Lower the charge current when cold. Nickel Based: Fast charging of most batteries is limited to 5°C to 45°C (41°F to 113°F).

How do you charge a battery if it's cold?

There are also other ways to charge batteries when dealing with colder and hotter temperatures. Lithium-ion batteries: A lithium-ion battery can undergo a fast charge at 41°F yet the charge rate should be lowered if under this temperature. No charging should ever be done to a lithium battery below freezing temperatures.

Do battery chemistries have a limited Charging temperature range?

Charging temperatures have an extremely limited range that differs between different types of battery chemistries. *Image Source: Most all battery chemistries will experience some type of damage when charging outside recommended temperature ranges.

What temperature should a starter battery be charged at?

Lead-acid: Lead acid is reasonably forgiving when it comes to temperature extremes, as the starter batteries in our cars reveal. Part of this tolerance is credited to their sluggish behavior. The recommended charge rate at low temperature is 0.3C, which is almost identical to normal conditions.

Why is my battery not charging at a low temperature?

protection when fast charging at low temperatures. Poor charge acceptance when cold mimics a fully charged battery. This is in part caused by a high pressure buildup due to the reduced ability to recombine gases at low temperature. Pressure rise and a voltage drop at full charge appear synonymous.
