

Can hydropower be used as a complementary power source of photovoltaic generation?

Complementation with hydropower is an important solution to solve the problems of grid connection and consumption of photovoltaic generation. Considering the randomness of photovoltaic output and runoff, hydropower station with good regulation capability is often used as a complementary power source of photovoltaic generation.

What is a hydro-PV complementary power generation system?

For the hydro-PV complementary power generation system, a PV power station is involved in the operation as an uncontrollable power plant of the hydropower station group.

Does hybrid pumped storage hydropower-photovoltaic (hps-h-PV) system have complementary scheduling rules?

This study explores the complementary scheduling for hybrid pumped storage hydropower-photovoltaic (HPSH-PV) system and evaluates the operation benefit and risk. First, the complementary scheduling rules that consider the demand for long-distance and across-regions power transmission are proposed to guide the peak-shaving operation of the system.

Can hydropower and pumped storage integrate wind and photovoltaic power?

Hence, utilizing hydropower and pumped storage in conjunction with wind and photovoltaic power generation on the supply side represents an effective approach to integrating wind and photovoltaic power and ensuring the stable operation of the grid.

Can pumped storage units transform a hydropower plant into a hybrid energy system?

This paper mainly focuses on a hybrid energy system comprising a hydropower plant (HPP), wind power station, photovoltaic station, and pumped storage station, as shown in Figure 1. Among the components of the system, pumped storage units are used to transform a conventional cascade hydropower plant into a hybrid pumped storage station.

Why do we need pumped storage capacity in complementary power generation systems?

Oversizing creates an economic burden, while too small a scale diminishes the system's regulatory capacity. Therefore, the configuration of wind power, photovoltaic power, and pumped storage capacities in complementary power generation systems is particularly crucial.

Determining reasonable pricing and trading strategies for the bundled hydro-wind-PV multi-energy complementary systems, as well as demand response mechanisms, is a critical ...

The complementary principle between hydropower and PV power generation lies in the fact that when the PV

power generation is insufficient to meet the demand, the surplus electric energy can be utilized to elevate the water level in the hydropower station reservoir, thereby storing water energy for future needs (Liu et al., 2011). However, the ...

Renewable energy is an inevitable means to achieve clean and low carbon development. In the future, China's power demand and power configuration adjustment still have large potential. High penetration of renewable energy in China requires a large-scale increase in hydropower, pumped-storage hydropower, wind power, and PV power in China.

This methodology was applied to an actual hydropower-photovoltaic (PV) complementary station in China. We found that (1) PV capacity integrated into the hydropower ...

The results can provide a reference for the clean, low-carbon, safe and efficient construction of multi-energy complementary energy system. However, there are still some limitations in the research object and model construction. For example, the participation of conventional hydropower and other VRE is not considered.

The southwestern region of China is rich in hydropower and wind energy resources, and cascaded hydropower stations provide a foundation for developing photovoltaic (PV) and wind power projects. By fully leveraging the regulation capacity of hydropower stations and pumped storage, the volatility of renewable energy generation can be reduced ...

Construct a hydro-PV complementary scheduling system based on conventional cascade hydropower by adding pumping station. Propose Complementary scheduling rules for ...

Integrating battery storage into a hydro-wind-PV (HWP) complementary system is promising for enhancing the system's flexibility, but it is unclear whether and how much battery storage can improve the complementary system. This paper proposes a methodology for evaluating the effects of battery storage on the system's complementarity.

Introducing pumped storage to retrofit existing cascade hydropower plants into hybrid pumped storage hydropower plants (HPSPs) could increase the regulating capacity of hydropower. From this perspective, a ...

After the optimization calculation, the output process of each unit in the hydro-wind-photovoltaic-accumulation-storage multi-energy complementary system in this paper is shown in Fig. 5. Cascaded hydropower units are used at higher outputs to track grid loads and smooth out large-scale wind-solar fluctuations.

In addition to the hydropower sources, pumped hydro storage (PHS), energy storage, and thermal power are also adopted in some renewable energy systems as the regulated power source. ... Apostolopoulou et al. [17] proposed a hydro-PV complementary optimal dispatch model to maximize the power generation head of

hydropower stations. Singh and ...

Hydropower, known for its robust regulatory capabilities, offers large-scale adjustable electricity through the swift operation of water turbine units [4, 12, 13] harnessing existing cascaded hydropower resources, the application of hydro-photovoltaic-wind systems (HPWS) presents a viable solution to address load shortage and power curtailment concerns [[14], [15], [16], [17]].

1 Yellow River Engineering Consulting Co., Ltd., Zhengzhou, China; 2 School of Electric Power, North China University of Water Resources and Electric Power, Zhengzhou, China; Photovoltaic and wind power is uncontrollable, while a hydro-pumped storage-photovoltaic-wind complementary clean energy base can ensure stable power ...

The coordinated scheduling of hydropower, wind and PV power plays an important role in promoting the large-scale development of new energy. Nevertheless, the complex comprehensive utilization tasks and peak-shaving demands of multi-regional power grids challenge the long-term scheduling of cascade hydro-wind-PV complementary system (HWPS).

Compared with other types of multi-energy complementary bases such as wind-photovoltaic, wind-photovoltaic-fire, and wind-photovoltaic-hydropower-storage, the wind-photovoltaic-hydropower-pumped storage generation systems have the advantages of strong regulation capacity, large transformation potential, and low cost (Sang et al., 2022), which ...

This paper aims to explore the transformation of traditional hydropower-wind-photovoltaic complementary systems into strategies that integrate hybrid pumped sto

With increasing scale of renewable energy integrated into the power system, the power system needs more flexible regulating resources. At present, besides traditional thermal and hydro power plants, pumped hydro storage and battery storage are the most commonly used resources, and they form a wind-thermal-hydro-storage multi-energy complementary system.

It can be seen in Figure 16 that the combined pumped-hydro-wind-photovoltaic hybrid system in this scenario has a better peak-to-valley regulation effect for the outgoing load because the adjustable ...

Energy Storage Opportunities; Pumped Hydropower: Leverage excess solar generation (instead of curtailing) to pump water into an upper storage reservoir for later hydropower generation ... Theories and methodology of complementary hydro/photovoltaic operation: applications to short-term scheduling. J. Renew. Sustain. Energy, 7 (2015), Article ...

Therefore, the hybrid pumped storage hydropower-wind-photovoltaic ... As a multi-energy complementary system, HPSH-wind-PV can not only use pumped storage units to meet the demand of power grid for peak

load and valley filling, but also use natural runoff to increase power generation [23, 24]. Wang et al. Yang et al., Ming et al. Zhu et al ...

The short-term operation modes of hydropower is restricted by the short-term peak-shaving demands of power grid and the compensation demands of REPP output fluctuation, which affects the operation efficiency of multi-energy complementary system [15]. Thus, in order to ensure the rationality of REPP capacity planning, it is necessary to construct a multi-energy ...

2.2 Optimization Planning. Based on the key problems in wind-PV-hydro-pumped hybrid systems, multi-objective optimization is used to analyze the system. Even if the complementary systems are equipped with large-capacity energy storage devices, the impact of the random and intermittent renewable energy on the power grid can be significant as power ...

The results show that complementary hydro/PV operation can remarkably improve the power quality of PV and is better able to reduce the peak load than a standalone hydropower plant.

The multi-energy complementary system of hydro, wind, and solar power of the Jinping-1 Hydropower Station in the Yalong river basin is used as an example for the study. ... An optimal operation method of cascade hydro-PV-pumped storage generation system based on multi-objective stochastic numerical P systems. J. Renew. Sustain. Energy, 13 (1 ...

The complementary operation of conventional hydropower and renewable energy can provide a reference for hybrid pumped storage, but the pumping station brings an energy conversion role that conventional hydropower does not have, increasing the complexity of how the HPSH-wind-PV system operates.

Many scholars have made outstanding contributions concerned with the hydropower-wind-photovoltaic complementary operation (HWPCO) by making use of different technologies in multiple time dimensions. ... Identifying the functional form and operation rules of energy storage pump for a hydro-wind-photovoltaic hybrid power system. Energy Conversion ...
