When the energy storage system lifetime is of 10 years, and the cost is equal to or more than 375 \$/kWh, the optimization configuration capacity is 0 MWh, which means no energy storage installation. The annual revenue of the simulated wind-storage system is 12.78 million dollars, which is purely from the sale of wind generation.

What is the annual revenue of wind-storage coupled system?

The annual revenue of the wind-storage coupled system is 12.78 million dollars, which is the income of wind generation only sold to the grid or customer. With the decrease of energy storage plant cost and the increase of lifetime, the best storage capacity and the corresponding annual income of wind-storage coupled system increase.

How long does a wind energy storage plant last?

When the energy storage plant lifetime is of 10 years, and the cost is equal to or less than 300 \$/kWh, with the increased efficiencies of both charging and discharging processes, the installed storage capacity and the annual revenue of the wind-storage coupled system increase.

How much does energy storage cost?

As shown in Fig. 9 and Table 6, the cost of energy storage plant is set to be 300 \$/kWh. The influence of charging/discharging efficiencies and lifetime on the best allocation storage capacity and the annual revenue of wind-storage coupled system is analyzed.

Therefore, energy storage systems are used to smooth the fluctuations of wind farm output power. In this chapter, several common energy storage systems used in wind farms such as SMES, FES, supercapacitor, and battery are presented in detail. Among these energy storage systems, the FES, SMES, and supercapacitors have fast response.
